ใบงานรวม 3–4 ส่วน B1 — ผลการรันจริง

ENGSE601 • Evidence Pack • Test execution record; honest status

ผลที่รายงานเป็น Pass ด้านล่างเป็นเพียงการรัน test logic file basic.test.js แบบ standalone; ไม่ได้รัน full Express/PostgreSQL app. TC-01..TC-06 ยัง Not Executed เพราะไม่มี live test database/runtime จากเครื่องผู้ใช้ในสภาพแวดล้อมนี้.

Execution context

Field	Record
Team / feature	TheOneBakery / order creation and total calculation
Source revision	public repo the-one-bakery-New/main; exact commit SHA not pinned in this report
Automated test actually run	node --test 03-test-execution/tests/basic.test.js (copied baseline assertions from repo tests/basic.test.js)
Observed result	3 tests passed, 0 failed; see evidence/TC-BASE_unit_2026-10-23.txt
Important limitation	Assertions cover a local status-flow array, a batch-rounding formula, and simple association math. They do not call API routes or connect to PostgreSQL. Not proof that the application works end-to-end.

B1 Step 1 — Test levels

Case	Level	Reason	Status
TC-01	Integration/API	POST /api/orders uses Express route and PostgreSQL transaction.	Not Executed
TC-02	Integration/API	Invalid product/order body should be validated at API + DB boundary.	Not Executed
TC-03	Integration/API	Quantity validation and database integer constraint interact.	Not Executed
TC-04	Integration	Resource check reads recipe/inventory and may reject before insert.	Not Executed
TC-05	Integration/System	Auth role + transition logic + DB history.	Not Executed
TC-06	Integration	Inventory movement and order status must update atomically.	Not Executed

B1 Step 2 — Automated test

Field	Result
File	03-test-execution/tests/basic.test.js
Command	node --test 03-test-execution/tests/basic.test.js
Evidence	evidence/TC-BASE_unit_2026-10-23.txt
Status	Pass: 3/3 assertions completed in standalone Node.js runner. Scope limited; this is not an integration test of app code.
Follow-up	Add/execute API tests for TC-01..TC-06 against an isolated PostgreSQL database. Save full command/output. Never change expected outcomes to match actual result.

B1 Step 3 — Manual System test

Field	Plan / current status
Case	Customer selects active product(s), changes quantity, checks total, submits an order, receives order number, and opens tracking link.
Expected basis	Proposed AC-ORD-01; formal SRS/approval is missing.
Actual result	Not Executed — no connected app instance / isolated test database accessible in this execution environment.
Evidence to capture	Screenshots of product selection, checkout total, confirmation number, track page; redact credentials and real customer data.
Owner / next action	A team member runs it on the team local app + test database and records the real result/date.

B1 Step 4 — UAT

Field	Plan / current status
Scenario	Shop representative processes a sample order from submit → admin review → production complete → packing → pickup; verify that each state shown matches the actual workflow.
UAT tester	Not appointed / no real representative session documented.
Status	Not Executed. Do not mark Pass until a user or authorized representative runs it.
Plan	Ask a representative to use synthetic test order on isolated environment; record date, steps, expected/actual outcome and screenshot evidence.

B1 Step 5 — Result table

Case	Level	Status	Evidence / reason
TC-BASE	Unit-like standalone assertions	Pass (3/3)	evidence/TC-BASE_unit_2026-10-23.txt; does not test app endpoints
TC-01..TC-06	Integration/API	Not Executed	No connected test DB/runtime; execute and attach real output before making a conclusion.
System manual	System	Not Executed	No screenshot evidence yet; follow Step 3 plan.
UAT	UAT	Not Executed	No representative test session documented.

Summary: automated baseline assertions Pass = 3; application API/system/UAT cases executed = 0. Fail = 0 is not evidence that the application passed those tests.
